PROFILE

Computer Science graduate (AUEB), building a career in data. I work in Python (Pandas) and SQL to collect, clean and analyse data and to spot patterns and trends, and I use AI/LLM tools daily to build data workflows and pick up new techniques quickly. Comfortable across the data lifecycle — from pulling data via APIs, to exploratory analysis, to clear reporting. Looking for a junior data role where I can contribute and keep growing.

SKILLS & TOOLS

- **Programming & Data:** Python (Pandas, NumPy), SQL, SQLite — collecting, cleaning, transforming and reconciling data; data-quality checks
- **Analysis:** Exploratory data analysis (EDA), pattern / trend / anomaly identification, basic statistics
- **AI / LLM tools:** Fluent using LLMs (Claude, ChatGPT) to build data workflows, debug and learn fast; retrieval-augmented generation (RAG); building simple AI agents
- **Visualization & Reporting:** matplotlib, seaborn
- **Familiar (bootcamp / project exposure):** Git/GitHub, Docker, FastAPI, PySpark/Databricks, Azure, React/Vite, Vercel, Railway

EXPERIENCE

Data & Operations Coordinator GamePlan Digital Football Agency | *Jan 2026 – Sep 2026*

- Consolidated, reconciled and validated player data from multiple agencies and external sources (Cosmos, Sports Connection, Fides), running systematic data-quality checks.
- Built and maintained an Excel player database (~75–80 records), standardising names and cross-referencing against Transfermarkt for data quality.
- Managed the matchday content pipeline: collected match materials and player information in a shared Drive, briefed the graphic designer, edited content in Photoshop and published stories/posts for matchdays, signings and transfers.
- Coordinated weekly with agents on which players to feature, keeping matchday posting timely across the roster.

Sales Consultant Kotsovolos | *Oct 2020 – Nov 2023*

- Advised customers in a high-volume, target-driven retail environment, consistently meeting sales targets and handling customer issues end-to-end, from first contact to resolution.
- Worked with performance metrics and reporting, and collaborated with the team to improve store results under pressure and tight deadlines.

Junior Software Engineer (Internship) Intelligencia.ai | *May 2019 – Aug 2019*

- Wrote automated validation tests (BDD, Cucumber.js/Gherkin) for the company's React web application.
- Startup environment with hands-on frontend exposure: React.js (hooks, async functions) and basic UI components in HTML/CSS.

PROJECTS

Premier League: Luck or Skill — xG Analysis *Personal project (Python, Jupyter) | 2026 – present*

- Analysed 12 Premier League seasons (2014/15–2025/26) of Understat match-level xG data to separate team quality from luck (actual points vs expected points).
- Tested year-to-year persistence with a self-join and Pearson correlation: quality persists ($r = 0.76$), overperformance does not ($r = 0.11$, $p = 0.14$), i.e. regression to the mean.

- Backtested two predictors of remaining-season points at every matchweek: xPts outperformed the league table at almost every stage.
- Applied the model to the live 2026/27 season to project final standings; documented methods, data-quality checks and limitations on GitHub.

AI Job-Search Agent *Personal project (Python, LLMs) | 2026*

- Building an AI agent that finds job postings, scores them against my profile and drafts a tailored CV for each role — combining LLM reasoning with structured data handling in Python.

Corpus — RAG pipeline over EU regulatory documents *Python (LangChain, ChromaDB, OpenAI) | 2026*

- Built a retrieval-augmented pipeline that answers questions over EU legislation (GDPR): document processing, vector search and an LLM answer layer.
- Developed around the Accenture × Code.Hub bootcamp, where I led the final team presentation to senior leadership.

Movie Analytics with SQL *Python, SQLite, SQL | 2026*

- Loaded the TMDB dataset into SQLite and answered analytical questions with SQL — top-rated titles, hidden gems, revenue-to-budget ROI and box-office flops.

rippl — Pi micro-donations web app *React, Vite, Tailwind · Vercel + Railway | 2026*

- Full-stack donation platform for the Pi Network (Pi SDK): React/Vite/Tailwind frontend on Vercel talking to a backend API on Railway. Live: pi-give.vercel.app

EDUCATION & TRAINING

BSc in Computer Science *Athens University of Economics and Business (AUEB) | graduated May 2025*

AI Knowledge Engineering with Data — bootcamp *Accenture × Code.Hub (GTGH program, ~90 hours) | May – June 2026*

Anthropic — courses on building with LLMs (MCP tools, AI Agents, Workflows) *online | in progress*

Databricks Academy — Data Engineering Plan (LakeFlow, Spark, Pipelines) *online | in progress*

LANGUAGES, INTERESTS & ADDITIONAL

- **Languages:** Greek — native • English — fluent (written & spoken)
- **Interests:** Competitive futsal; football data & analytics; building small tools with AI
- **Other:** Military service completed (2025–2026) • Driving license (Cat. B), own car
